

# The 5-minute guide to IIoT for food manufacturers

# The 5-minute guide to IIoT for food manufacturers

The Industrial Internet of Things (IIoT) is a concept that has been on the radar of the food and drink manufacturing industry for several years now, but many manufacturers are still reticent to make the leap between the theory and practical implementation until they have a clear vision of what this will entail.

Most manufacturers have recognised that new IIoT technologies will play a significant role in delivering improvements in operational efficiency and uptime. However, there may still be questions relating to the technical skills required to deploy IIoT into the manufacturing environment, as well as the associated costs and benefits.

Some manufacturers are starting to make progress, putting the concept into practice in areas like quality compliance and packaging efficiency, demonstrating that quick wins are possible with IIoT even in specialist manufacturing environments.

Our eBook aims to explain the relevance and value of this technology for food manufacturers and by so doing, reduce the gap between the theory and the practical use of IIoT.
